PT Single chain antibodies specific for erbB-2 protein, gpl85 - with PT labels or cytotoxin, useful for detection and treatment of tumour PT cells expressing this protein
PS Example 9; Columns 27-30; 28pp; English.

CC The present cDNA sequence codes for a claimed single-chain antibody e21

CC designated e21(FV), which binds to erbB-2. Monoclonal antibody e21

CC was generated by immunising mice with N/erbB-2 cells overexpressing the gpl85 protein, removing spleen cells and producing hybridomas by standard techniques. Messenger RNA coding for the anti-erbB-2 coding for the heavy- and light- chain variable regions were then complified by PCR and joined via a sequence encoding a peptide linker. The resulting single-chain antibody is useful for in vitro cliswhich overexpress the erbB-2 gpl85

CC marker, e.g. breast, ovarian and non-small cell lung carcinomas, cand, when coupled to a cytotoxic agent, to treat such tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      05-JUN-1997 (first entry)
Single-chain anti-erbB2 antibody e21(Fv) cDNA.
Single chain antibody; variable region; light chain; heavy

T binding domains for separate targets joined by helical peptide,
T useful e.g. for diagnosis and treatment
S Example 1; Fig 11; 50pp; English.
C The VL and VH sequences of the anti-CD3 hybridoma G19-4 were
amplified by PCR methods. A gene fusion was constructed from the
C two amplified domains and a (G1y4Ser)3 linker. The amino
C terminus of the VL-VH fusion cassette was fused at the Sall site to
C the L6 light chain variable region leader peptide and the
C carboxy-terminus was fused directly to the hinge region of the PC
C domain at the Bcl1 site and/or to a short "helical" peptide linker
C to construct the bispecific CD3-L6FvIg antibody derivative. The
C the helical liker fort included in frame to the opposite end of

                                                                                       Complete the containing a target binding molety capable of binding to a complex receptor (SECR), and a nucleic acid binding to a complex receptor (SECR), and a nucleic acid binding molety. This can be used in a method for delivering an oligonucleotide to a commandian cell. The method comprises conjugating the target binding to a complete to a nucleic acid binding molety to form a carrier and coupling the carrier to an expression vector encoding one or more gene products to form a pharmaceutical composition. A mammalian cell having on its conditions allowing binding to the receptor resulting in delivery of the pharmaceutical composition to the interior of the cell. The composition and method are used for the introduction of exogenous genetic material into target host cells expressing SECR on their surface. The nucleic acid may encode a functional wild-type or mutant gene or may be an antisense comprosed to a cell surface via the SECR binding molety. The nucleic acid can be compacted at high concentrations with the carrier molecule at a critical salt concentration. The such complexes comprose only of more expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 18; Page 29; 37pp; English.

MAb capable of binding to the gamma chain of the IL-2 receptor, and thus of blocking the IL-2 response, is produced by mouse hybridoma line GP-4 (FERM BP-4640). DNA encoding the variable region of this MAb was expressed in E. coli, yielding Fv(GP-4) with immumosuppressive activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Expression-secretion vectors - for prodn. of biologically active antibody Fv fragments or single chain Fv molecules Disclosure; Fig 6; 51pp; English.

This sequence encodes a single chain Fv molecule which contains the heavy and light variable portions (VH and VL) of antidigitoxin monoclonal antibody (MAD) 26-10, a signal sequence and a linker monoclonal antibody (MAD) 26-10, a signal sequence and a linker between the two variable regions. This sequence was used in the construction of an expression-secretion system for the production of biologically active Fv fragments. The system also contains a DNA sequence encoding the T7 promoter. The secretion expression vector was produced by polymerase chain reaction (see also Q41070-81). Fv fragments comprising only the VH or VL regions, and single chain concluses may be used to specifically bind one or more of the same antigens as the full length antibody from which they are derived.                                                                                                                                                      Disclosure; Fig 3; 26pp; English.

The sequence is an Ndel-Hindlil fragment encoding the L and H chains of murine MAD OVB3, joined together via a linker. The sequence is present in clone povB3158-1 in which the 3' end is linked to the 5' end of the coding sequence for PB40, a a Pseudomonas exotoxin lacking domain I. The protein expressed by the clone can be used to kill specific target cells.

New antigen binding proteins contg. immunoeffector or cytolytic peptide - attached to variable regions of antibody light or heavy chain, useful in diagnosis and in destroying cancer cells Example 1; Fig 4A-B; 72pp; English.

A novel DNA construct (T29058) codes for a single-chain antigen-binding fusion protein (R97380) comprising the light chain variable region (VL) of monoclonal antibody Cd49 linked to the CC49 VH region via a spacer peptide (R97379). With a C-terminal
                                                                                                                                                                                                     WO9611955-A1.

It was obtd. by ligating a synthetic PLAP frexisting CC49/212 gene, and can be used to produce the protein in transformed host cells. The fusion protein the tumour antigen-binding capability of CC49 with the immunoeffector function of PLAP.
